

Applying the skills I have learnt throughout the project in my placement has been an insightful and engaging experience. In week 6, my main focus was to make the house model interactive on a web page, for example, clicking on the lights could be used on the page with a lighting effect, and clicking on individual parts such as walls, windows, etc. would display some specific data information about that part of the house.

In addition, I explored how to set up the model structure in the model so that it works better with the code to produce the interactive effects to be achieved.

Looking ahead to week 7, I will continue to work on the interactive part of the house model. Last week, I implemented the ground floor; this week, I will work on the first floor part to achieve the desired effect. I will also communicate with the people involved in making the model to understand the specific part of the model that the data corresponds to and to increase its accuracy.

Overall, I am committed to continually learning and ensuring continued progress on the project. I look forward to taking on new challenges during my internship.
